

**ONC FHIR at Scale Taskforce (*FAST*):**  
Scalable FHIR Infrastructure to Facilitate  
Data Exchange

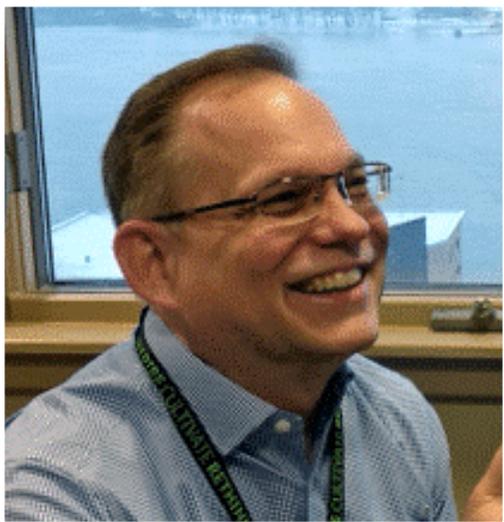

# FAST Taskforce Antitrust Notice

- The ONC FHIR At Scale Taskforce (*FAST*) (Hereinafter “Taskforce”) is committed to full compliance with existing federal and state antitrust laws.
- All members involved in the Taskforce effort, including its advisory groups, will comply with all applicable antitrust laws during the course of their activities. During Taskforce meetings and other associated activities, including all informal or social discussions, each member shall refrain from discussing or exchanging competitively sensitive information with any other member. Such information includes, but may not be limited to:
  - Price, premiums, or reimbursement charged or paid for products or services
  - Allocation of customers, enrollees, sales territories, sales of any products or contracts with providers
  - Any other competitively sensitive information that is proprietary to a member company
- If you have any specific questions or concerns, seek guidance from your own legal counsel.
- Members should not bring confidential information or intellectual property (hereinafter “Intellectual Property”) owned by their respective member companies into Taskforce meetings. To the extent such Intellectual Property is shared with the Taskforce that shall not be construed as a waiver of member company’s rights to, or ownership in, the Intellectual Property.

# Presenters – FAST Chief Architects

**Patrick Murta**  
Chief Interoperability  
Architect & Fellow,  
Humana  
*FAST* Chief Architect

# Agenda

- **What is FHIR?**
  - API Overview
  - FHIR and the Health Care Ecosystem
- **What is *FAST*?**
  - *FAST* Organization
  - Importance of Ecosystem Infrastructure and the *FAST* model
  - Showcase *FAST* Proposed Solutions: Identity, Security, Testing and Certification
- **Learn More & Get Involved with *FAST***

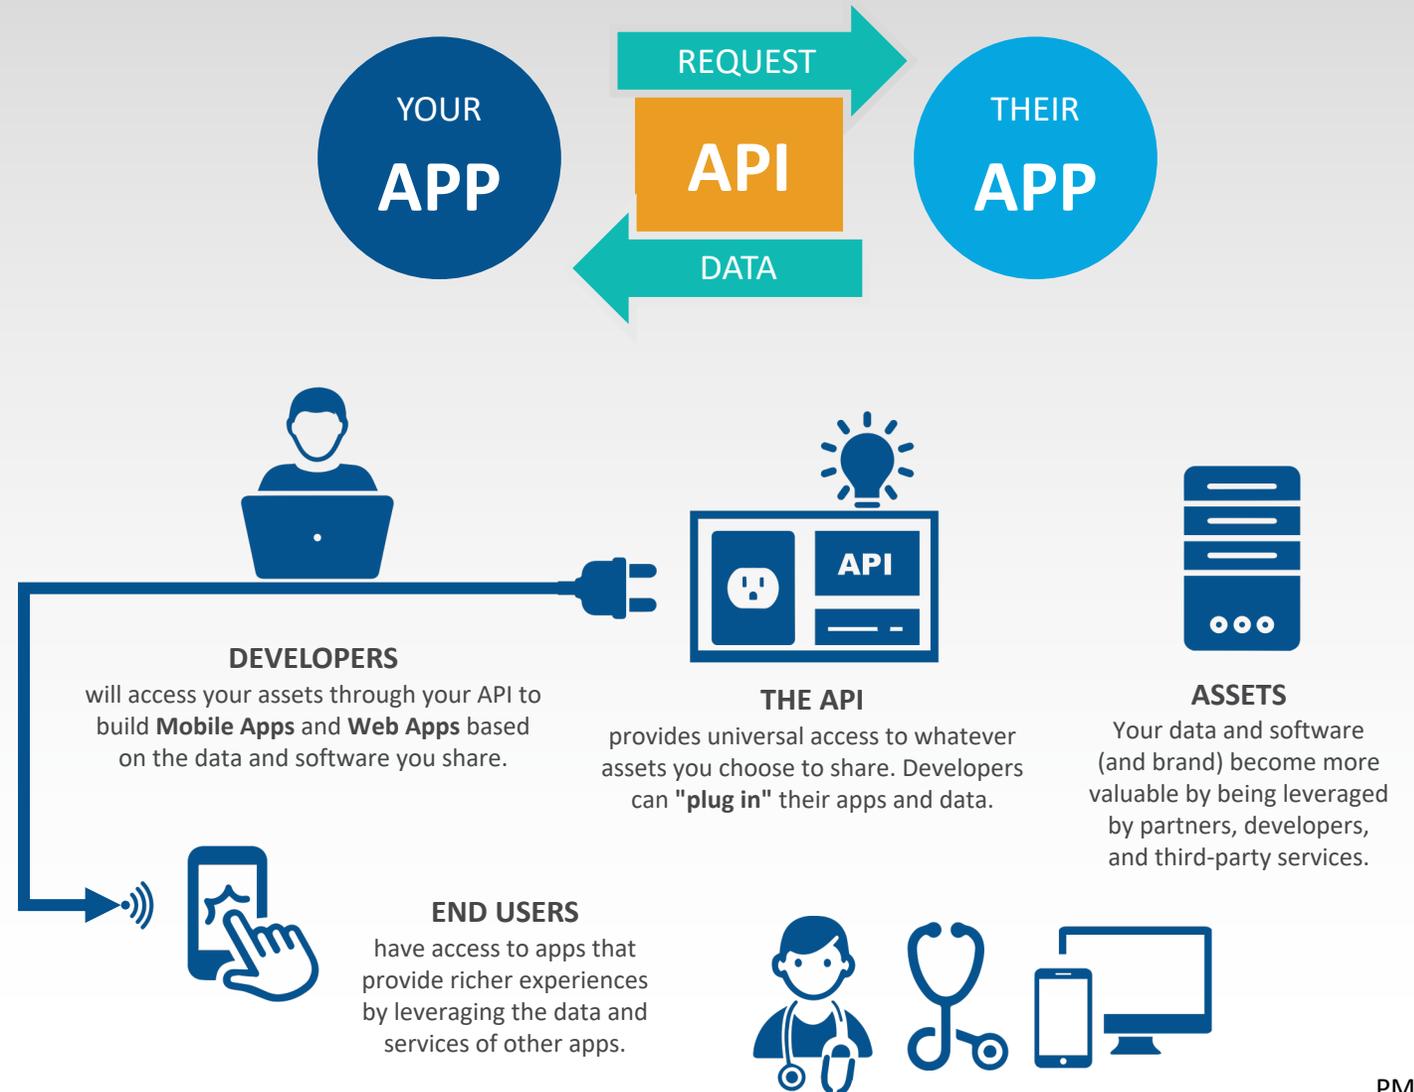

# API Overview

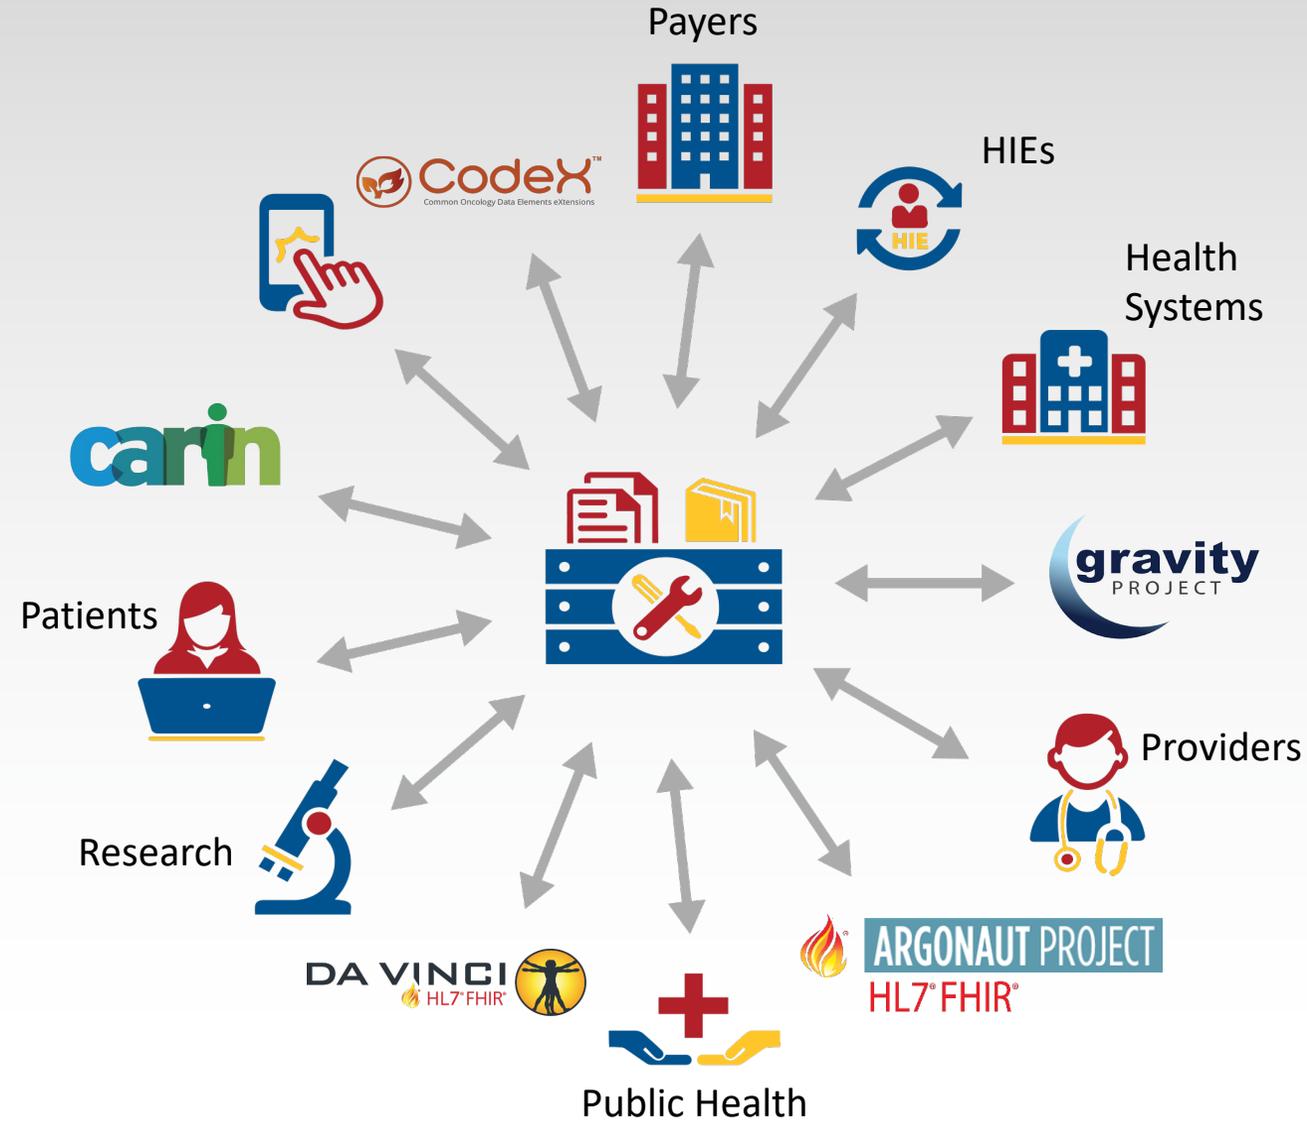

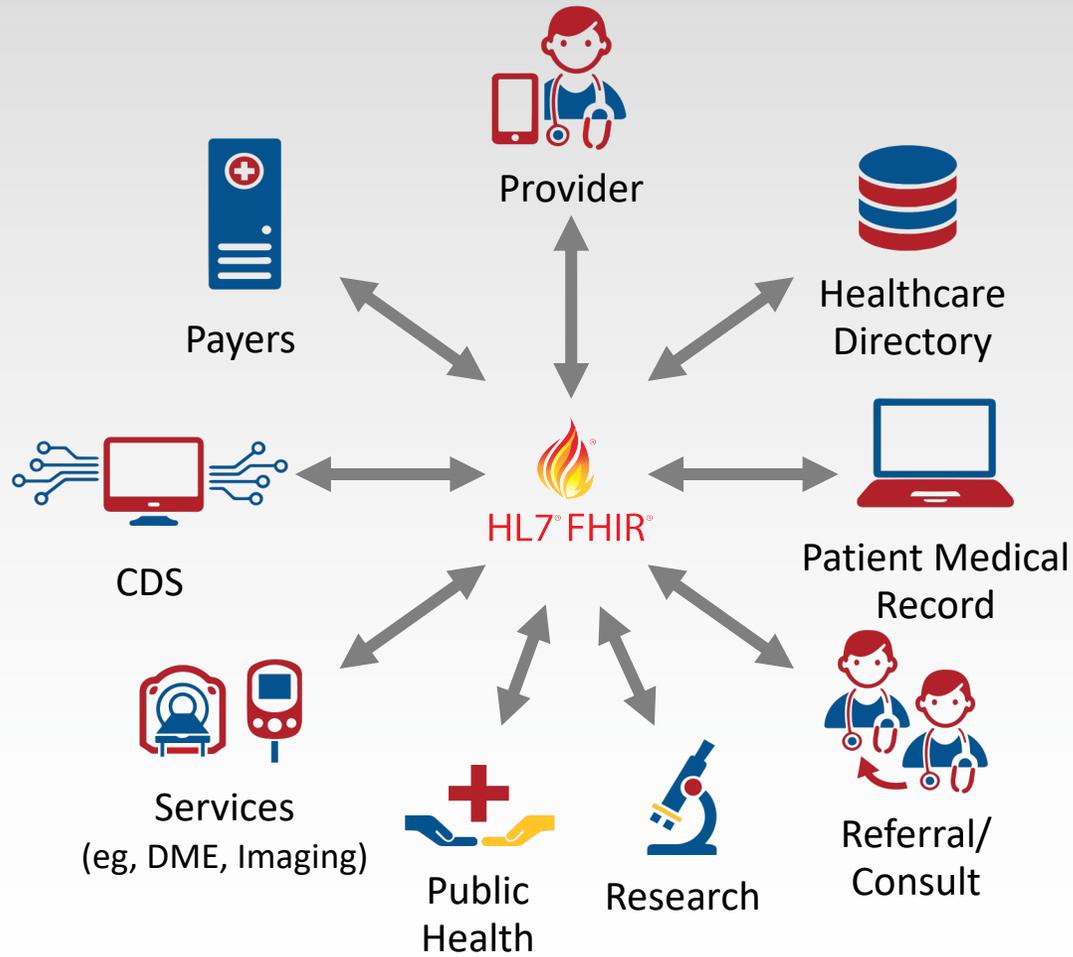

## APIs...

- An API is a software intermediary which allows applications to talk to each other
- **APIs** allow the capabilities or data of one computer program to be used by another
  - Lego blocks of data
  - Doesn't matter what the underlying computer or technology is
- **APIs** are a foundational technology that drives modern computing and the API economy (Amazon, Netflix, Google, Facebook, EBay, YouTube, Twitter, & etc.)
- **APIs** enable innovation in an unprecedented manner
- **APIs** are not new... simplified, easy to use versions of them are

# FHIR and the Health Care Ecosystem

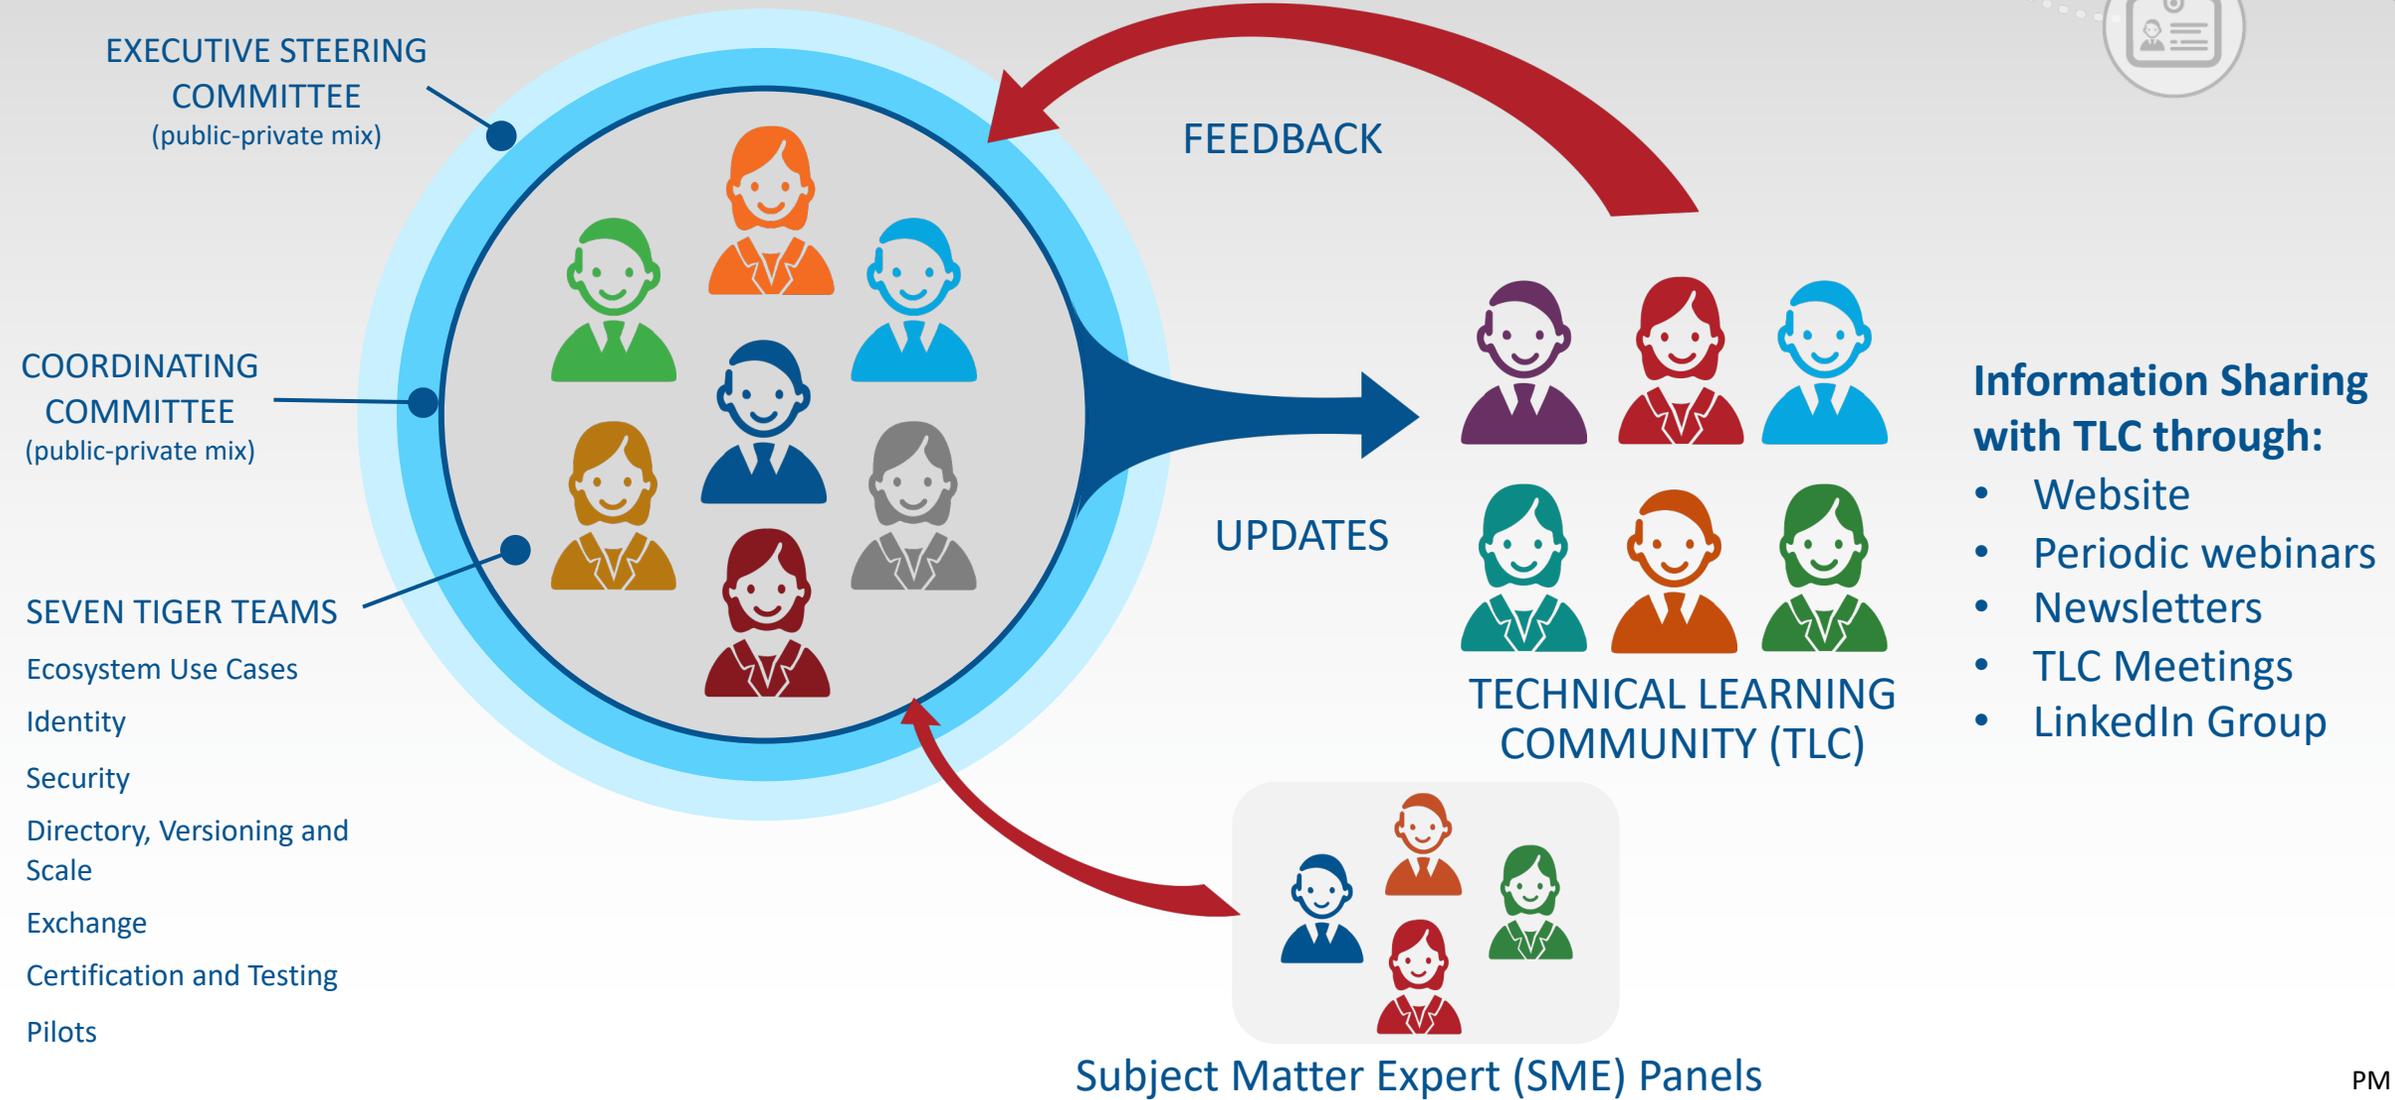

## What is *FAST*?

*The FHIR at Scale Taskforce (FAST), convened by the Office of the National Coordinator for Health IT (ONC), brings together a highly representative group of motivated healthcare industry stakeholders and health information technology experts.*

*The group is set to identify HL7<sup>®</sup> Fast Healthcare Interoperability Resources (FHIR<sup>®</sup>) scalability gaps and possible solutions, analysis that will address current barriers and will accelerate FHIR adoption at scale.*

# FAST Organization & Community Engagement

# Lack of Consistent Infrastructure Impacts Flow

# Well-Planned Infrastructure Creates Efficiency

# Example FHIR Transaction Journey in the FAST Ecosystem

Patient visits Primary Care Physician (PCP)

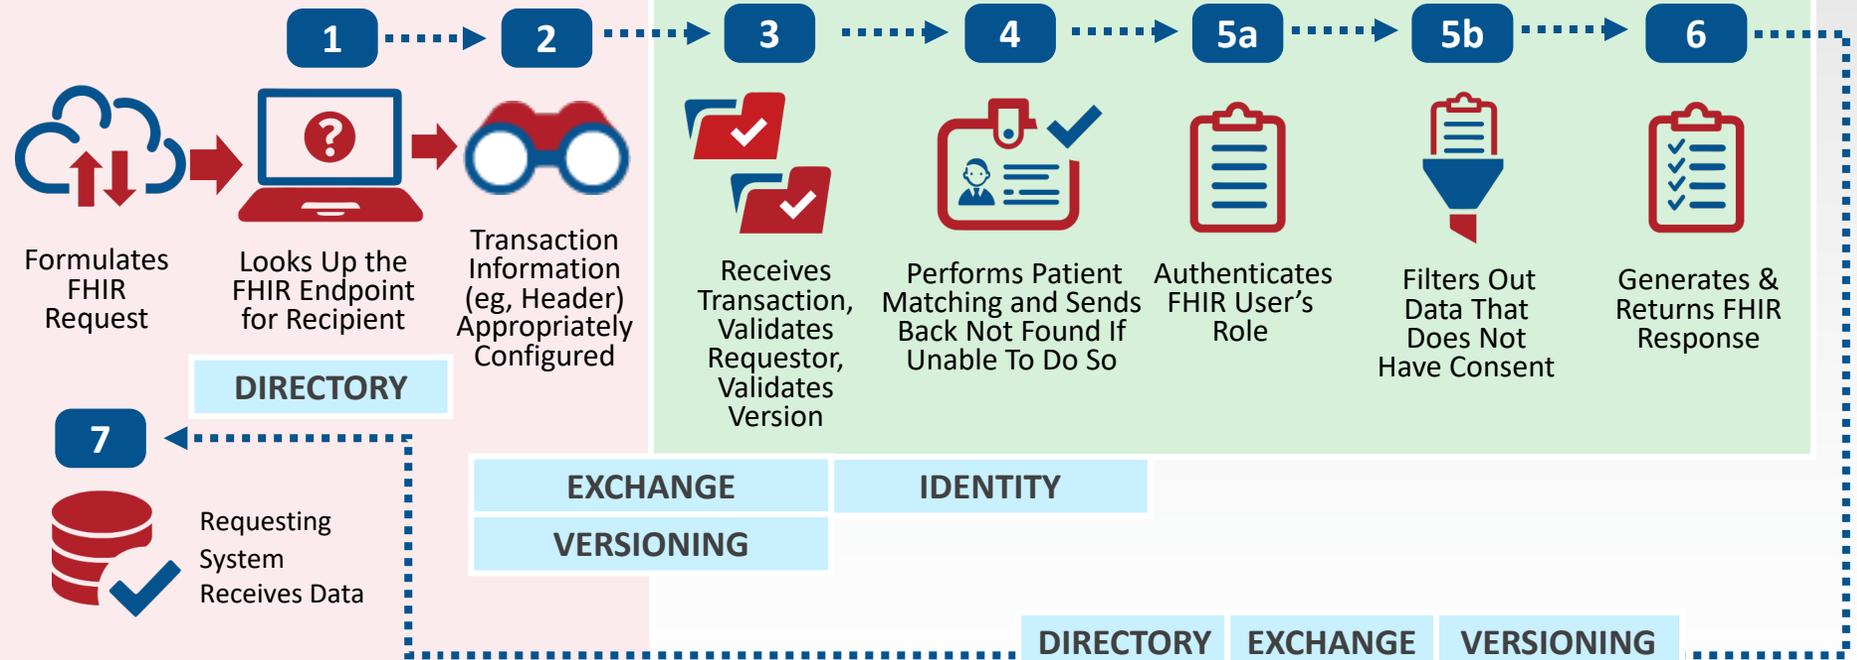

PCP needs information from Payer

Payer receives PCP request

## REQUESTING SYSTEM

## RECEIVING SYSTEM

PCP views patient information

**CONFORMANCE & CERTIFICATION**

# Conceptual Integrated Architecture

## Security (Authenticate/Authorize)

UDAP Trusted Dynamic Client Registration - UDAP Tiered OAuth User Authentication - UDAP JWT-Based Client Authentication - UDAP JWT-Based Authorization Assertions

CONFORMANCE & CERTIFICATION (Testing & Certification Program)

PILOTS (FAST Capability Vetting with Existing HL7 Accelerators)

# FHIR Scalability - Technical Challenges & FAST Proposed Solutions

## DIRECTORY, VERSIONS AND SCALE

### DIRECTORY

**CHALLENGE:**

There are multiple places to find endpoints. Is there a place I can go to find all of them?

**PROPOSED SOLUTION:**

A national solution for FHIR Endpoint Discovery

### VERSIONS

**CHALLENGE:**

A way to communicate and manage multiple versions

**PROPOSED SOLUTION:**

Supporting multiple production versions of FHIR

### SCALE

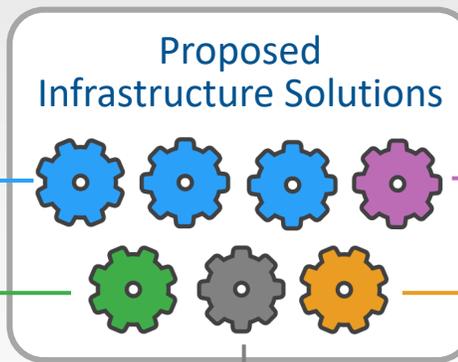

**CHALLENGE:**

How can a high volume of FHIR transactions be consistently and predictably exchanged in a hybrid exchange model?

**PROPOSED SOLUTION:**

Requirements for FHIR RESTful exchange intermediaries

## EXCHANGE PROCESS

**CHALLENGE:**

How do we enable consistent and reliable transaction exchange?

**PROPOSED SOLUTIONS:**

- Reliable Routing with Metadata Across Intermediaries
- Reliable Routing Across Intermediaries Using Destination Specific Endpoints

## TESTING & CERTIFICATION

**CHALLENGE:**

A way to measure conformance to the standard

**PROPOSED SOLUTION:**

ONC FHIR Testing and Certification Program

## SECURITY

**CHALLENGE:**

How do we manage permissions & security across millions of patients/payers/providers?

**PROPOSED SOLUTIONS:**

- UDAP Trusted Dynamic Client Registration
- UDAP Tiered OAuth for User Authentication
- UDAP JWT-Based Client Authentication
- UDAP JWT-Based Authorization Assertions

## IDENTITY

**CHALLENGE:**

How can a requestor and receiver uniquely identify the patient/member?

**PROPOSED SOLUTIONS:**

- Mediated Patient Matching
- Collaborative Identifier for Patient
- Distributed Identity Management
- Networked Identity Management

# ***FAST* Solutions Overview**

# ***FAST Identity Management***

# FAST Identity Barriers to FHIR Scalability

## IDENTITY BARRIERS

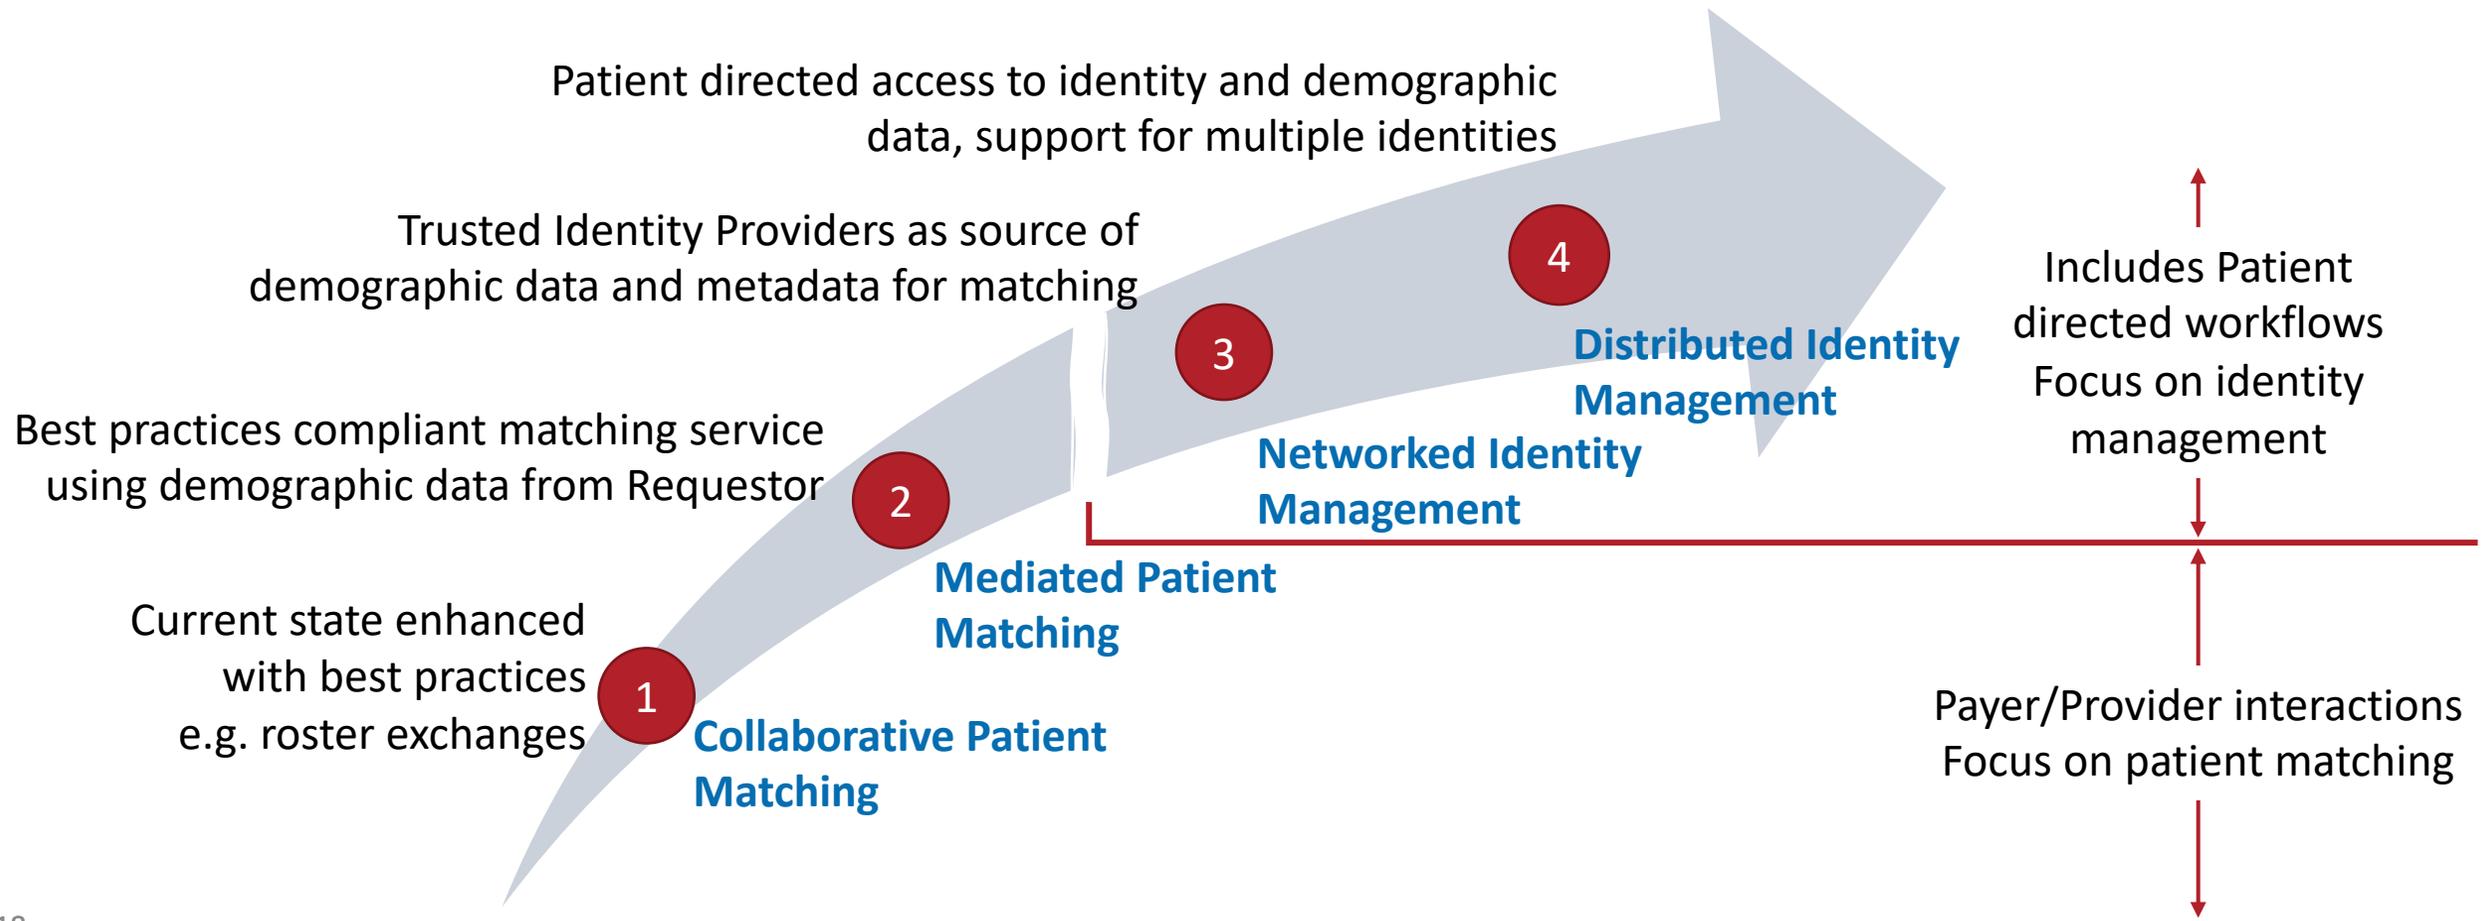

## IMPLICATIONS

<b>USE OF DIFFERENT IDENTIFIERS</b>	How do we know who the patient is? The payer? The physician?	➔	Identifiers such as medical record numbers and insurance ids are not meaningful beyond the boundaries of a specific organization. They are of limited value in identity matching across organizations.
<b>MINIMUM DATA SET</b>	How do we know the minimum patient data to use in matching?	➔	Reliably identifying Patients across organizations may require a minimum necessary set of data to be included in the transaction. This set of data may not always be available for all use cases.
<b>PRIVACY</b>	What patient data should be returned in responses, including error messages?	➔	Privacy considerations must be applied in developing recommendations on data to be sent in responses, including error messages.
<b>CUSTOM IDENTITY MATCHING PROCESSES</b>	Can we rely on the consistency of identity-matching services across organizations?	➔	Most organizations utilize custom built identity matching processes and any proposed solutions from FAST will need to accommodate this diversity.
<b>CROSS-WALKS ARE NOT SCALABLE</b>	How do we map patient identity real-time?	➔	Small groups of organizations may exchange Patient and Provider rosters, thereby building a common and perhaps shared cross walk for identifiers. However, this solution is not scalable at the national level and real-time identification may be impacted by data latencies in maintaining the crosswalks.
<b>LIABILITY</b>	How do we address the misidentification risk?	➔	Liability in the event of overlaps, overlays, duplicate records, and incorrect matches could require legislative consideration beyond technical recommendations.

# Solution Options: Low to High Complexity

Multiple options progressing from low to high complexity (technical and process)

# ***FAST Security***

# Problems to be Solved

<b>CREDENTIAL SPRAWL</b>	How can we minimize the number of credentials the requestor and responder are required to securely maintain?
<b>CLIENT APPLICATION SPRAWL</b>	How can we streamline the registration and user of client applications across multiple endpoints?
<b>AUTHENTICATION &amp; AUTHORIZATION</b>	How can we increase assurance that the requestor is appropriately authenticated and has the authorization to review and use the data requested?
<b>EXISTING PROCESSES &amp; TOOLS LIMIT SCALABILITY</b>	Techniques such as Open Authorization (OAuth 2.0) are widely accepted but can they be extended to improve scalability in FHIR?
<b>HIPAA MINIMUM NECESSARY</b>	<p>When payers have access to patients' medical records using FHIR, the question of "minimum necessary" will become a significant issue since the current human mediated response will no longer take place.</p> <p>However, having direct access to clinical data allows the industry to reduce provider burden by decreasing the number of manual interventions providers need to manage to exchange data with payers and other providers.</p> <p>Instead of setting the bar at the "minimum necessary," which can be interpreted differently by different stakeholders, the industry will need to move away from concerns about data access and shift toward defining the stated purpose for using the data (e.g., "I need access to these data for quality reporting measures"), which then becomes the approved use.</p>

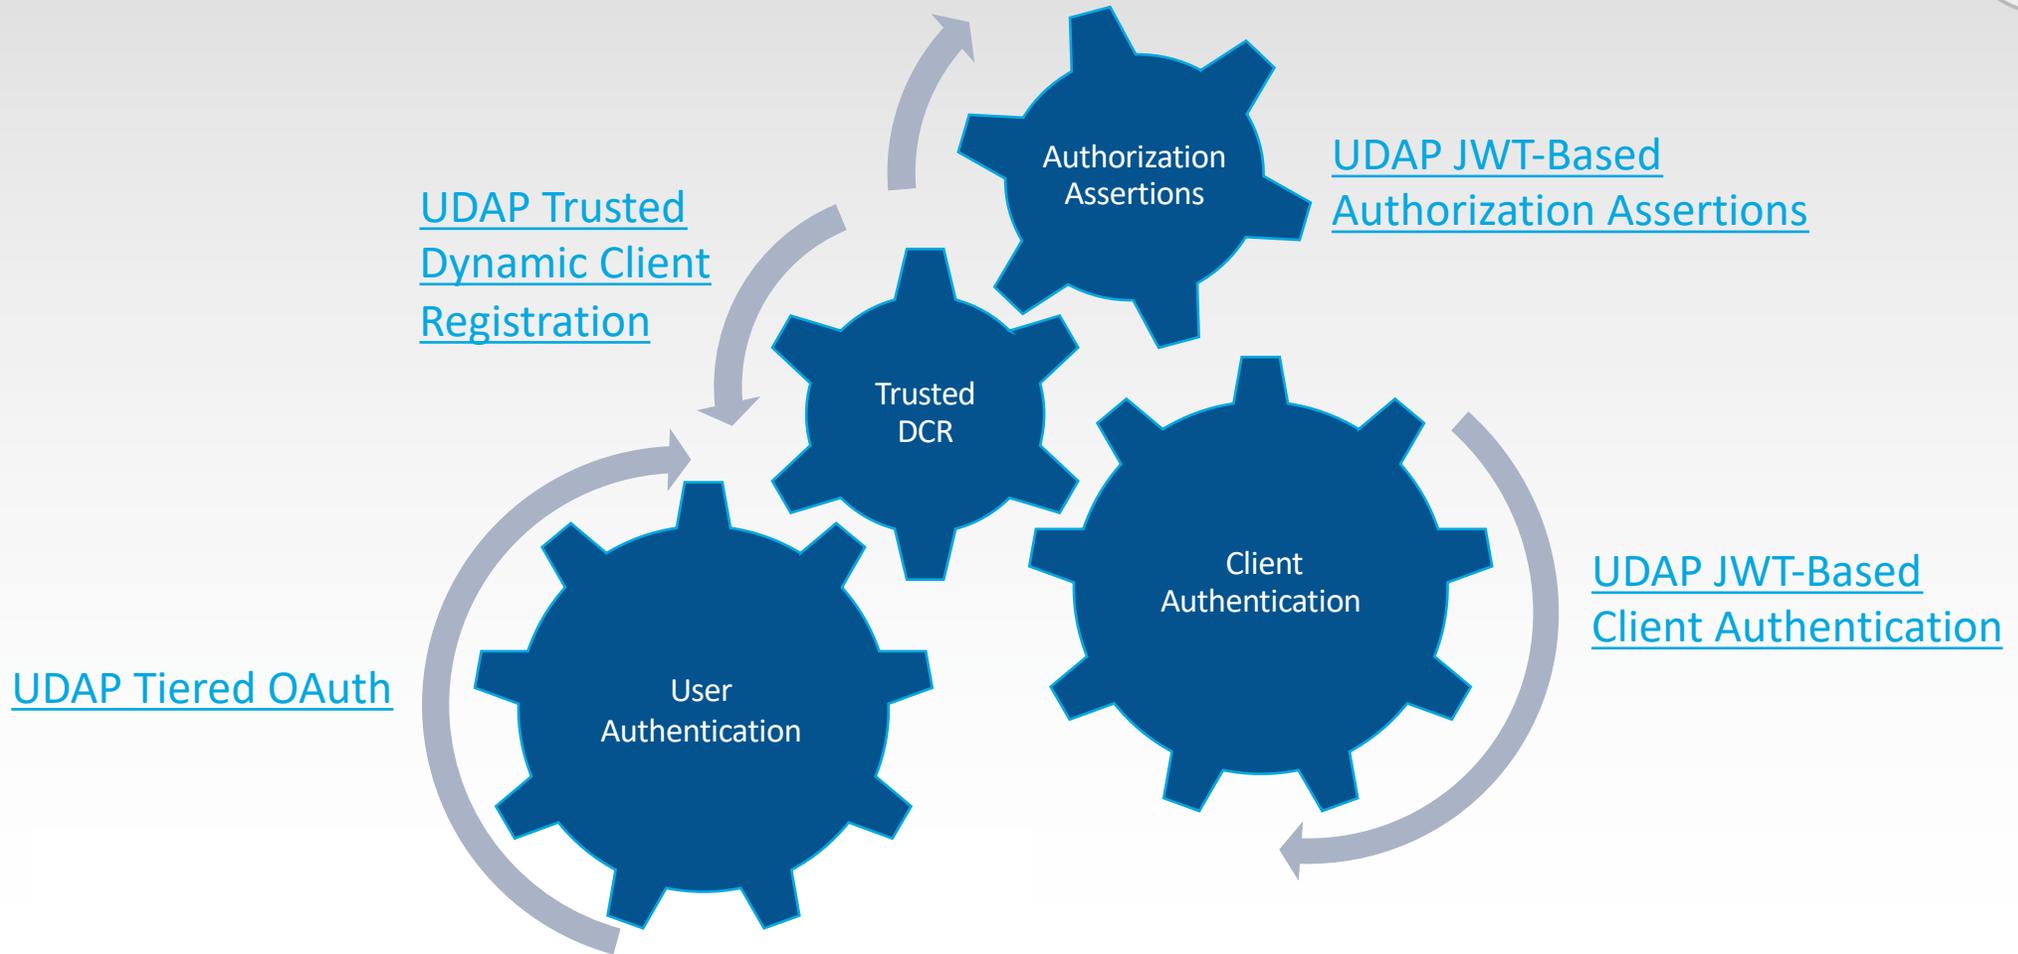

# FAST Solution Approach

- **Leverage existing credentials and authorizations**
  - Enabled by portable electronic requestor certifications
  - Securely communicate the verified attributes behind a requestor's digital identity to responder
- **Enable federated access**
  - Federated use of credentials
  - Federated authorization servers
- **Leverage best practices (existing standards) — workable solutions**
  - OAuth 2.0 Authorization Framework
  - OpenID Connect
  - Unified Data Access Profiles
  - PKI-Based Health Information Networks
- **Facilitate automated exchange (i.e., reduce bottlenecks)**
  - Minimize time for participants to actively exchange with a new endpoint
  - Identify areas where solutions to authorization and authentication can be reused in more than one technical exchange protocol
- **Implement Role Based Access (where necessary)**
- **Reuse existing infrastructure where possible**

# Proposed Solution: Trusted Ecosystem

# ***FAST*** Testing & Certification

# FAST Testing & Certification Barriers to FHIR Scalability

## TESTING/CERTIFICATION BARRIERS

## IMPLICATIONS

**Maturity of Requirements**

FHIR specification itself is continually evolving. Any conformance process needs to account for versioning with full backward compatibility

**Lack of Minimum Level of Conformance**

Need to be able to assume Conformance to BASE FHIR prior to working on scaling, but this pushes the limits for this group's scope

**Tooling**

Needs to support validation of several layers, multiple versions and standard tests

**Certification Governance**

Define steps and levels to achieve certification, what or whom is being certified (i.e., FHIR implementation approach or participants, stakeholders, and intermediaries)

**Costs**

Costs must not be prohibitive to vendors who are developing systems for payers, providers, or patients

# Steps to FHIR Scalability

**FHIR SPECIFICATION  
CONFORMANCE**

**INFRASTRUCTURE USE  
CASE CERTIFICATION**

**FUNCTIONAL  
USE CASES**

**RAPID INDUSTRY  
ADOPTION**

1. Conformance statements
2. Resources, Profiles and Operations
3. FHIR Versions

  15. Reliable Payor Identification

# Proposed Solution: Automated FHIR Testing Platform – Scope

## In Scope

- Base FHIR Specification
- *FAST* Readiness Criteria

## Out of Scope

- HL7 FHIR Validation Engine
- RFP development to select entity to provide services
- Validate ease of establishing connections
- Validate conformance to non-blocking requirements
- Validate conformance to HIPAA patient privacy regulations

## Assumptions

- Easy to use and submit FHIR transactions
- Dashboard Review of transaction with feedback
- Cost of certification is low and is not a barrier

## Pre-Conditions

- This program must either commit to validating Base FHIR conformance or use a separate conformance assessment
- Specifications and requirements are agreed upon
- FHIR Validation Engine is determined
- Certifier(s) are selected
- Developers involved in reviewing and beta testing of platform are committed to process

## Post-Conditions

- Systems will become ONC *FAST* Certified, which ensures interoperability with other ONC *FAST* Certified systems
- Reporting process and mechanism will be in place
- Feedback mechanism for developers/users will refine and streamline the process
- Ongoing interaction will occur with HL7, ONC, developers and other key stakeholders

**Complexity:** High

FHIR AT SCALE TASKFORCE

## Technical Barriers to HL7® FHIR® Solutions Scalability

The FHIR at Scale Taskforce (FAST) has identified a series of technical barriers that need to be addressed in order to scale Fast Healthcare Interoperability Resources (FHIR) as a ubiquitous technology that enables wide-scale clinical information exchange between providers, payers, and other stakeholders. These barriers include a lack of a FHIR endpoint locator, lack of common authentication and authorization approaches to ensure appropriate patient privacy, gaps in the ability to bridge patient identity across stakeholders, and a lack of industry-wide governance and versioning for FHIR Application Programming Interfaces (APIs).

The FAST initiative brings together a highly representative, collaborative group of motivated healthcare stakeholders and health information technology experts who are working to analyze and synthesize the solutions across the industry, and to further identify infrastructural and scalability gaps and barriers, with the objective to propose a suite of solutions that will accelerate FHIR adoption at scale.

The following technical barriers identified by the FAST team were found to impede the adoption of FHIR at scale and will be the basis for FAST-proposed scalability solutions:

1. Directory Services
2. Identity
3. Security
4. Testing, Conformance, & Certification
5. Versioning
6. Scaling

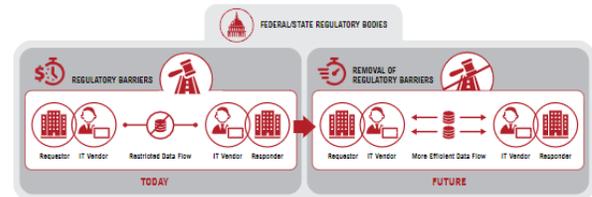

**FAST**  
FHIR AT SCALE TASKFORCE

## Regulatory/Policy Barriers to HL7® FHIR® Solutions Scalability

The FHIR at Scale Taskforce (FAST) has identified regulatory and policy barriers that need to be addressed in order to scale Fast Healthcare Interoperability Resources (FHIR) as a ubiquitous capability that enables wide-scale clinical information exchange between providers, payers, and other stakeholders.

These barriers include the HIPAA minimum necessary regulations, the naming of a standard in a way that limits innovation, the lack of a single patient identifier, and the cost of accessing data via FHIR Application Programming Interfaces (APIs).

The industry is interested in scaling FHIR use. The most recent Centers for Medicare & Medicaid Services (CMS) Notice of Proposed Rulemaking (NPRM) and the Office of the National Coordinator for Health IT (ONC) NPRM (published in the federal register on March 4, 2019) call for widespread use of APIs to enable consumers to access their health data and foster industry-wide adoption. However, the following regulatory and policy barriers impede scalable FHIR adoption, and they are the focus for which FAST will identify potential solutions:

1. HIPAA Minimum Necessary
2. Regulatory Mandate for a Single Named Standard
3. Patient Identifier
4. Data Blocking
5. Use of NPPES as the Repository for Endpoints
6. HIPAA Transactions Requiring X12

**FAST**  
FHIR AT SCALE TASKFORCE

## Endpoint Discovery

### Introduction & Background

The purpose of the FHIR at Scale Taskforce (FAST) is to augment and support recent HL7® Fast Healthcare Interoperability Resources (FHIR®) efforts focused on ecosystem issues that, if gated, can accelerate adoption.

### Reference Documentation

FAST Technical Barriers

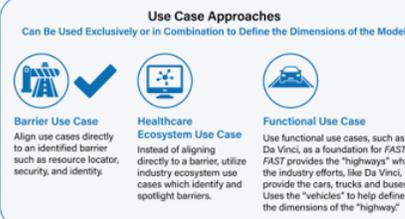

**Identify**  
Barriers to adoption and opportunities for synergy:  
• Endpoint Services  
• Security Approaches  
• Identity Resolution  
• Versioning & Scale Approaches  
• Testing Approaches  
• Regulatory/Policy Needs

**Why**  
Removing barriers and aligning consensus-based adoption via the network effect will accelerate adoption of FHIR for the production exchange of clinical information between providers and payers

**How**  
**Analyze** — look, learn, understand FHIR pilots/prototypes/deployments underway  
**Synthesize** — Subject Matter Expert (SME) evaluation, identify trouble spots, develop best practices and proposed solutions  
**Catalyze** — through additional standards work, barrier identification, testing, pilots, and leveraging existing resources

FAST use case model is unique in that it describes ecosystem needs as opposed to specific functional use cases. Use cases for FAST are derived in one of 3 approaches as described in the graphic below.

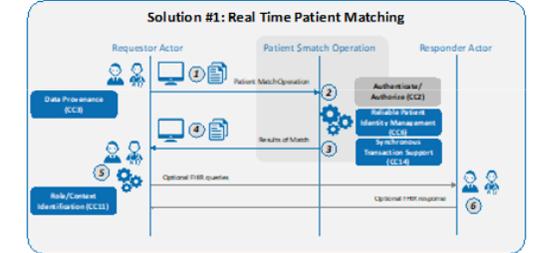

SF-UC Endpoint\_Discovery-Core\_Capability-CCI

**FAST**  
FHIR AT SCALE TASKFORCE

## Proposed Solutions: Identity

### Supporting Diagrams & Flows

ID	Description	Notes
1	<p>Patient Smatch Request: Requestor Actor calls a Patient Smatch operation provided by the Responder Actor or a trusted intermediary of the Responder Actor.</p> <p>The Smatch request will use Patient resource in the request. The attribute "onlyCertainMatches" will be set to true for Use Cases involving Patient Care Delivery.</p> <p>As an optional pre-cursor to the Smatch, the Requestor may verify the Patient's demographics to the best of their ability, ranging from a manual verification of identification such as Driver's Licenses to automated checks against non-healthcare databases such as credit bureau records, if warranted.</p>	<p>To do: Define minimum and optional set of attributes to improve match scores.</p> <p>List use cases where onlyCertainMatches must be set to true.</p> <p>Identify recommended limits for "count" for example use cases.</p>
